

Laila Afmeged

Associate Data Scientist, Defense Contractor | M.S. Data Science Candidate, Johns Hopkins University

I'm an Associate Data Scientist at a defense contractor, where I support microelectronic devices and superconducting chip programs, building ETL pipelines, anomaly and failure detection tools, and dashboards that turn raw operational data into decisions. I hold a Bachelor's degree in Cloud Computing from Morgan State University, and I'm currently pursuing a Master's degree in Data Science with a concentration in AI and Machine Learning at Johns Hopkins University. This site tracks the Python projects I build throughout my coursework, starting with the project below from Module 1.

Projects

Module 1 Assignment: Personal Website

This site itself is the Module 1 project: a personal developer website built with Flask, using the application factory pattern and Blueprints to separate the Home, Projects, and Contact pages into independent modules. Jinja2 templates share a common layout and navigation bar, and a single stylesheet controls all colors, spacing, and the two-column bio/photo layout on the homepage.
